

This rehabilitation program is designed to return the individual to their full activities as quickly and safely as possible, following a total ankle replacement. Modifications to this guideline may be necessary dependent on physician specific instruction or other procedures performed. This evidence-based total ankle replacement guideline is criterion-based; time frames and visits in each phase will vary depending on many factors. The therapist may modify the program appropriately depending on the individual's goals for activity following a total ankle replacement.

This guideline is intended to provide the treating clinician a frame of reference for rehabilitation. It is not intended to substitute clinical judgment regarding the patient's post-operative care based on exam/treatment findings, individual progress, and/or the presence of concomitant procedures or post-operative complications. If the clinician should have questions regarding post-operative progression, they should contact the referring physician.

Phase	Suggested Interventions	Goals/Milestones for Progression
Pre-Op Phase	PT Instruct patient in use of assistive device	Goals of Phase: 1. Demonstrate safe ambulation 2. Able to maintain NWB status on surgical side
Phase I	Immobilization: Cast, splint; after two-week follow-up visit, removable	Goals of Phase: 1. Skin healing
Date of Surgery – 2 – 3 Weeks	boot WB Status: Non-weight bearing Gait training with correct use of crutches/walker/knee scooter	 Protection of joint replacement Perform ADL's safely and independently with us of crutches/walker/knee scooter while maintaining NWB status on surgical side
		Criteria to Advance to Next Phase: 1. Sutures are removed

TOTAL ANKLE REPLACEMENT GUIDELINE Orthopedics

Phase II	Immobilization:	Goals of Phase:
	Use of removable walker boot at all times	1. Healing
Weeks 2 – 6		2. Protection of joint replacement
	WB Status:	
Expected visits: 1	Weight bearing in boot as tolerated	Criteria to Advance to Next Phase: 1. Cleared by Physician with
	 Therapy: Beginning with gentle passive range of motion for two-weeks Scar tissue mobilization Progress to active ROM: one to two times per week with focus on swelling reduction and pain control if 	appropriate healing for stage begin rehab @ 6-8 week.
	 needed Home care exercise instructions for motion, pain and swelling control of ankle. HEP for strengthening of core, hips, and knees maintaining ankle precautions 	
	 ROM: AAROM, PROM, patient stretching and joint mobilization*. Techniques for inversion and eversion should be minimized and may be contraindicated if the patient has had ancillary procedures such as subtalar fusion or triple arthrodesis. The distal tibiofibular syndesmosis should not be mobilized. Soft tissue techniques may be used for swelling reduction and scar tissue mobilization. *Joint mobilization should focus on techniques for general talocrural distraction and facilitation 	
	dorsiflexion and plantarflexion. NOTES: No strengthening against resistance if any tendon transfers	

Phase III	Immobilization:	Goals of Phase:
	Begin transition into a regular shoe per physicians	1. Swelling reduction
Weeks 6 – 12	recommended schedule. Use of removable walker for first two-weeks. Shoe wearing schedule: Day 1: 1 hour/day	 Increase in ROM Neuromuscular re-education Develop baseline of ankle control and strength
	Day 2: 2 hours/day	Criteria to Advance to Next Phase:
	Increase 1 hour /day until 8 hours of wear May split time in half for am/pm Example: Day 1: 1 hour/day (30 min am, 30 min pm)	 Normal Gait pattern Pain control Edema managed
	If painful, do not advance to next day. If painful with 4 hours, wear boot remainder of day. Start over with Day 4 the next day and do not go to day 5.	
	WB Status: WBAT*	
Rehab Program Weeks 6 - 12	*WB status and gait progression determined by physician and based on radiographic evidence of implant incorporation.	
Weeks o - 12	Therapy: One to two times per week based on patient's initial presentation. Frequency may be reduced as the patient exhibits good recovery and progress towards goals, instruction in home care and exercise to complement clinical care.	
	Once full weight bearing, may progress to treadmill ambulation	
	Scar mobilization PRN	

ROM: AROM, PROM, patient directed stretching and joint mobilization*. Techniques for inversion and eversion should be minimized and may be contraindicated if the patient has had ancillary procedures such as subtalar fusion or triple arthrodesis. The distal tibiofibular syndesmosis should not be mobilized.	
*Joint mobilization should focus on techniques for general talocrural distraction and facilitating dorsiflexion and plantarflexion.	
Goals: less than or equal to 10° of dorsiflexion and 30° to 40° of plantarflexion.	
Strength: Techniques should begin with isometrics in four directions with progression to resistive band/isotonic strengthening for dorsiflexion and plantarflexion. Due to joint fusions, eversion and inversion strengthening should continue isometrically. Band should progress to heavy resistance as tolerated. Swimming and biking allowed as tolerated.	
Step program: forward, lateral, and backward as tolerated. Begin 2-3" and progress to normal step height.	
Gait Training: Emphasis on smooth cadence, heel strike, and return to walking program	
Proprioception: May begin with seated BAPS board and progress to standing balance assisted exercises as tolerated.	

Phase IV	WB Status:	Goals of Phase:
	Full; patient should exhibit normalized gait	1. Functional ROM
Weeks 12 – <u>24</u>		a. Ideal: 10° DF, 35° PF
	Therapy:	2. Strength 5/5
	One time every two to four weeks based on patient status	3. Adequate proprioception for
	and progression. To be discharged to an independent	stable balance
	exercise.	4. Normalize gait
		5. Tolerate full-day of ADLs/work
	ROM:	6. Return to reasonable
	Patient to achieve greater than or equal to 10° of dorsiflexion and 40° of plantarflexion.	recreational activities
	Note: Patients with prior ankle fusion may be limited in	Criteria to Advance to Next Phase:
	ROM to 5° of dorsiflexion and 30° to 35° of plantarflexion.	1. Discharge to independent
		exercise program once goals
		are achieved
	Strength:	Patient to be instructed in
	Progression to body weight resistance exercises with goal	appropriate home exercise
	of ability to perform a single leg heel raise.	program
	Proprioception:	
	Single leg activities progressing into higher level balance	
	& proprioception activities (therapad, rebounder, etc.)	
	Patient should be instructed in proprioceptive drills that	
	provide both visual and surface challenges to balance.	
	Agility:	
	Cone/stick drills, leg press plyometrics and soft-landing	
	drills	
	Sports:	
	Prior to return to any running or jumping activity, patient	
	must display a normalized gait pattern and have strength	
	to perform repetitive single leg heel raise.	
	Ideally, no repetitive high impact sports or occupations.
